

Meeting Agenda

Continuous Assessment for Revision Control

Client Meeting 1

Meeting Details

Date: [TBD]
Time: [TBD]
Location: [TBD]

Attendees:

- **Clients:** Professor Mike Fraser, Professor Tilo Burghardt
- **Developers:** Hrushikesh Emkay, Josh Jenkins, Yuxuan Wang, Mihaly Toth-Tarsoly, Jack Dempsey

Meeting Objectives

- Introduce team members and establish communication preferences
- Review and clarify project requirements and scope
- Discuss technical approach and architecture preferences
- Align on timeline, milestones, and deliverables
- Define next steps and action items

Agenda

1. Introductions and Welcome

- Team introductions
- Roles and responsibilities
- Communication preferences

2. Project Overview

- Overall queries about the project
 - Overarching goals
 - Do you plan on introducing AI to assessments in the future? How would that change the project?
 - “A strong system would allow AI-based commits to enable unassessed materials to be integrated into and complement the wider assessment”. What do you mean by this?
 - Can you explain the entire workflow you currently use to assess coursework, starting from assigning it to giving the final marks? What do lecturers and students not like about this?
 - Why do you want to do this?
 - Do you have any specific requests or requirements?
- Target Users and Key Stakeholders
 - Is this application aimed at just computer science students or students from other courses?

- If it is going to be used by students of other courses, what sort of document formats do you expect to have? (docx, pdf, pptx)
- Is this going to be used in the real world?
- Is this required to be used by non-technical clients?

3. Requirements and Scope

- Core features and functionality
 - What features are non-negotiable within the final product?
 - Do you need Microsoft SSO / University login?
 - Do you expect us to use existing models for any AI features or expect us to create our own models?
 - What are the most important features for lecturers?
 - Do you have any expected workflows?
 - How reliable does the system have to be, how fault-tolerant, etc?
 - What problems do you and students have with the current way assessment tracking and assessment is done?
 - Would you like a more visible deadline countdown than currently in blackboard?
- Minimal Viable Product (MVP)
 - How would you like the students to upload files, in order to simplify version control?
 - What are the functional expectations for the MVP?
- Nice-to-have items
 - What features would a perfect solution contain?
 - Would you like test running, graph of tests passed, etc.? For example, equivalent environment to lab machines. Keeping track of tests passed throughout the assessment.
 - Lecturer comments on submitted code?
 - Check that the formatting of the submission is correct (preflight checks), i.e. naming of files
 - Run tests from the lecturer, not the ones from the student.
 - Exclude some files, e.g. images, don't upload all files, just the code ones. Lecturer can exclude some files.
 - Functionality for branches within the web app?
- Integration requirements
 - Is there software with which the application will have to integrate with?
- Proposed technology stack
 - Is there a preferred technology stack for the project?
 - Any preference on using SQL or not?

4. Timeline and Milestones

- Project phases and key milestones
 - Minimal Viable Product (MVP) Release: 20th November
 - Beta Release: 19th February
 - Final Release: 30th April
- Are these alright as rough dates? is there any reason why feedback couldn't be given on these dates?

6. Open Questions and Discussion

Follow-up

Next Meeting: [Date , time and Location]

Availability: [Available for consistent meetings and Feedback Sessions?]
